The warm gas atmosphere of the HD 100546 disk seen by Herschel*

Evidence of a gas-rich, carbon-poor atmosphere?

ABSTRACT

Context. With the Herschel Space Observatory, lines of simple molecules (C^+ , O , and high- J lines of CO , $J_u = 14$) have been observed in the atmosphere of protoplanetary disks. When combined with ground-based data on $[C^+]$, $[O]$, and principal bands of carbon can be related. These data allow us to test model predictions for the main carbon-bearing species and verify the presence of a warm surface layer. The chance of neutral carbon (C^0), which is predicted by models to be strong, can thus be interpreted together with neutral C^+ and carbon monoxide.

Aims. We study the gas temperature structure, and chemical structure of the simple carbon-bearing species C^+ , O , and CO , as well as O by the method of chemical-physical modeling. Using the models, we explore the necessity of the loss to the circumstellar disk structure due to the inner disk evaporation.

Methods. Numerical models of the radiative transfer in the inner and outer disk were solved together with a chemical network calculation and a calculation of the gas temperature to obtain the gas temperature. We present our new model, which is based on our previous model, but includes several improvements that we report in detail, together with the results of benchmark tests.

Results. A model of the disk around the Herbig Ae star HD 100546 is reproduced by the CO disk together with the main fluorescence lines of $[C^+]$ and other $[C^+]$ $[C^0]$. We find that the high- J lines of CO can only be reproduced by a warm atmosphere with $T_{rot} = T_{exc}$. The low- J lines of CO , observable from the ground, are reproduced by the outer disk with a radius of around 100 AU, while the high- J CO observations with Herschel/PAZ are dominated from regions within one star of AU. The spectral profiles of high- J lines of CO are predicted to be broader than those of the low- J lines. To study the effect of several parameters including the size of the disk, the gas mass of the disk, the initial chemical mix distribution, and the amount of carbon in the gas phase.

Conclusions. The main mechanism of our work is (i) only a warm atmosphere with $T_{rot} = T_{exc}$ can reproduce the CO disk in the CO disk system with $[C^+]$ and $[C^0]$ as reported by the models with a fixed $[C^+]$ and $[C^0]$ ratio and a low abundance of volatile carbon. These models however produce too small amount of $[C^+]$. Models with a low gas dust ratio and some volatile carbon also reproduce $[C^+]$ and $[C^0]$. We do not agree with observations of $[C^+]$ low abundance $[C^+]$. Owing to the uncertain ratio of the $[C^+]$ emission, we prefer the high gas dust ratio models, indicating a low abundance of volatile carbon.

Key words. Protoplanetary disks – Stars: formation – Accretion – Atmospheres – Methods: numerical

1. Introduction

As an important phase of a young low-mass star's life, the so-called protoplanetary disk (proplyd disk) is considered to be the site where planets form (see review by Proppen et al. 2005 and Arzoumanian et al. 2011 for recent reviews). Our own solar system consists of a planet formation stage, from protoplanets that build the disk and the gas content of the disk need to be studied in order to understand the formation. The structure of the forming star into the disk can help decide the disk's fate. The disk structure that, besides the gas, dust and including the chemical composition of the gas by high-energy stellar (UV) radiation and X-rays. Through heating of the disk's upper atmosphere, a disk wind is driven, which may eventually shape the disk (Shen et al. 2008; Braker et al. 2008; Koenig & Hollenbach 2009). The most abundant species tracing the ionizing radiation and the temperature of the 100 K are ionized atomic carbon (C^+), atomic oxygen (O), and high- J lines of CO ($J_u = 14$). Apart from neutral carbon, which is accessible to ground-based telescopes, these species can now be observed using the PAZ instrument (Gardill et al. 2010) onboard the Herschel Space Observatory (Pilattini et al. 2010).

The main focus of carbon (C^+ , C^0) and CO can thus be observed for the first time and through high- J CO lines also in warm regions. This allows us to probe the carbon chemistry and the physical structure of planets and cometary forming zones, which were previously inaccessible to us. The carbon budget is important for planet formation, since the terrestrial planets in the inner Solar System are known to have a deficit in carbon of three orders of magnitude relative to the solar abundance

- established in 1991 by Paul Ginsparg
- has been hosted at Cornell since 2001
- includes 731,000 e-prints
- 2011
 - 76,578 new submissions
 - ~50 million downloads

3

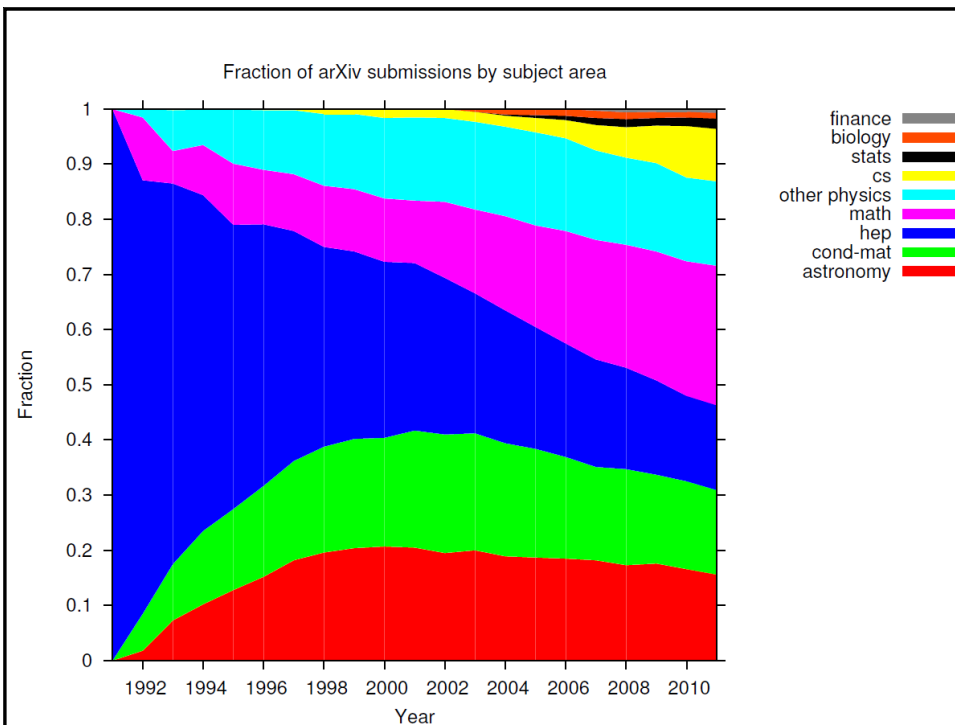

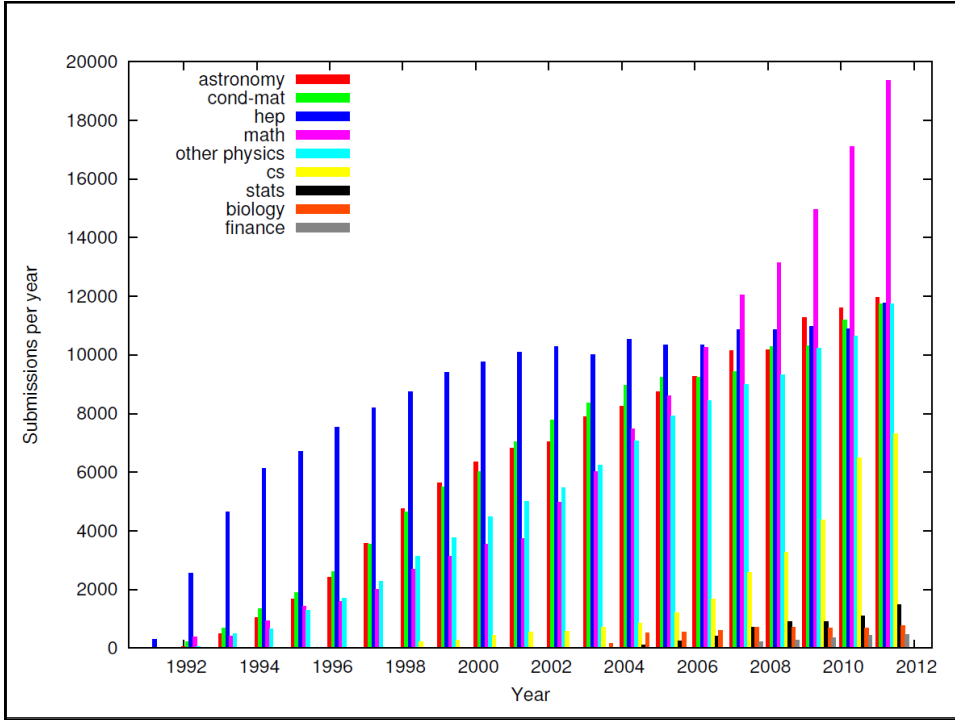

Key Principles

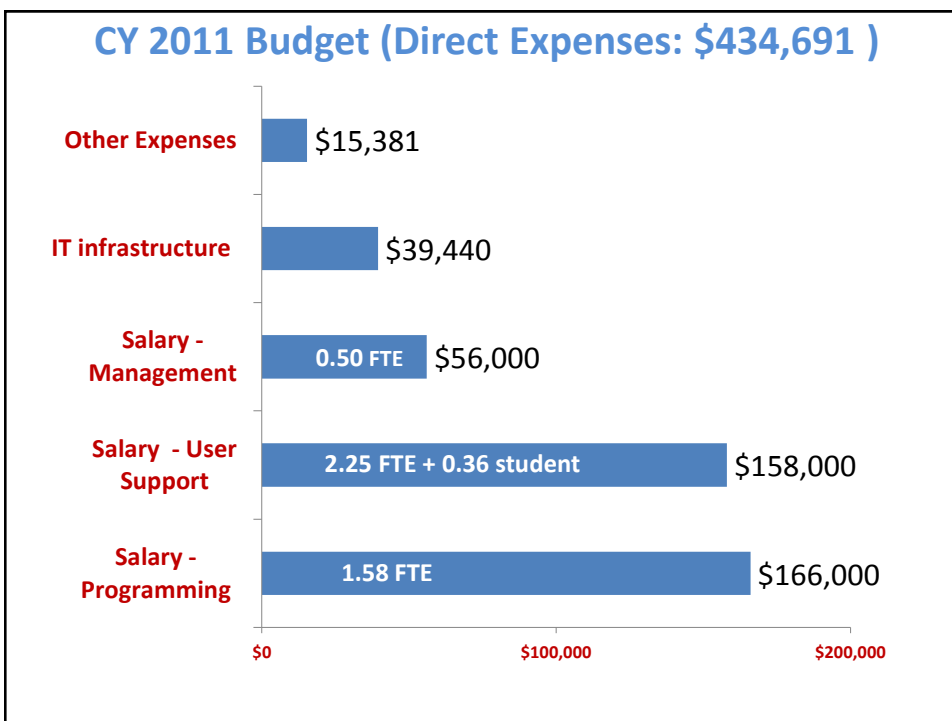

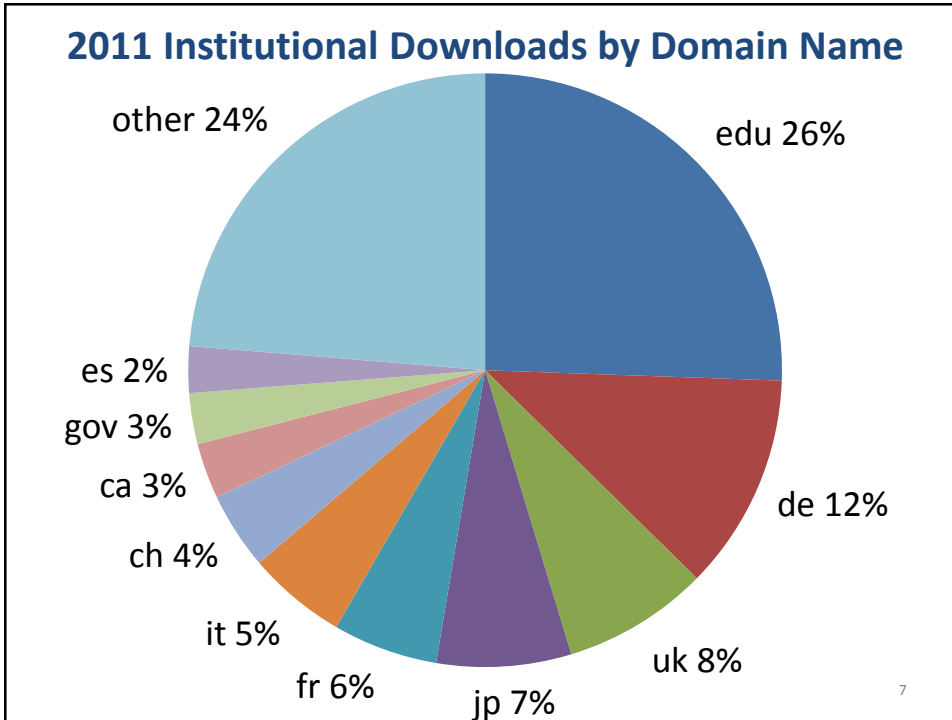

- arXiv is an open access service, free to submitters and users alike
- arXiv is a culturally embedded resource that provides value to a global network of science researchers
- arXiv has a moderation system to ensure content quality
- arXiv complements, rather than competes with, the commercial and scholarly society journal publishing market

arXiv Support

Cornell University Library is beginning an effort to expand funding sources for arXiv to ensure its stability and continued development. We are working to establish a collaborative business model that will engage the institutions that benefit most from arXiv — academic institutions, research centers and government labs — by asking them for voluntary contributions. Our plans are outlined in the [2010-01-21 press release](#) and additional information is given in:

- [arXiv Supporters: 2010, 2011, 2012](#)
- [arXiv Support FAQ](#)
- [arXiv Institutional Usage Statistics: 2009, 2010](#)
- [arXiv Support Updates: July 2010, December 2010, April 2011, July 2011, October 2011](#)
- [arXiv Business Model White Paper](#)
- [Additional Information](#)

Contacting arXiv Funding Support

For questions related to institutional contributions or other funding for arXiv please contact arXiv at support@arxiv.org. For technical or moderation queries please [contact arXiv administrators](#) and do not send email to the support address.

sustainability planning update

Interim Sustainability Model 2010-2012

*3-year collaborative support model with **voluntary** contributions from libraries and research institutes*

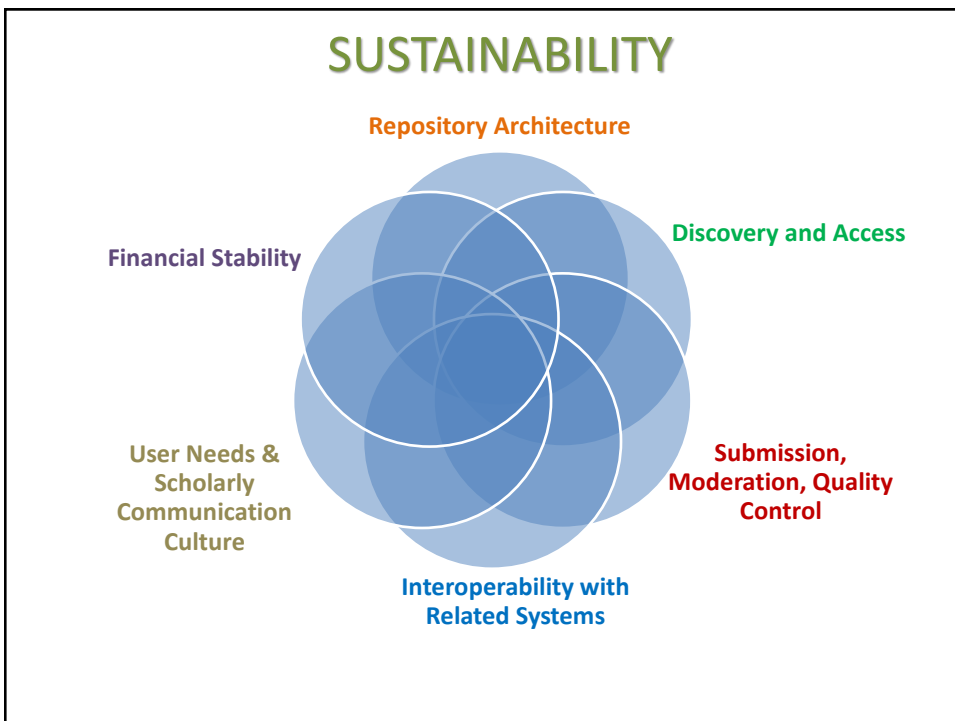

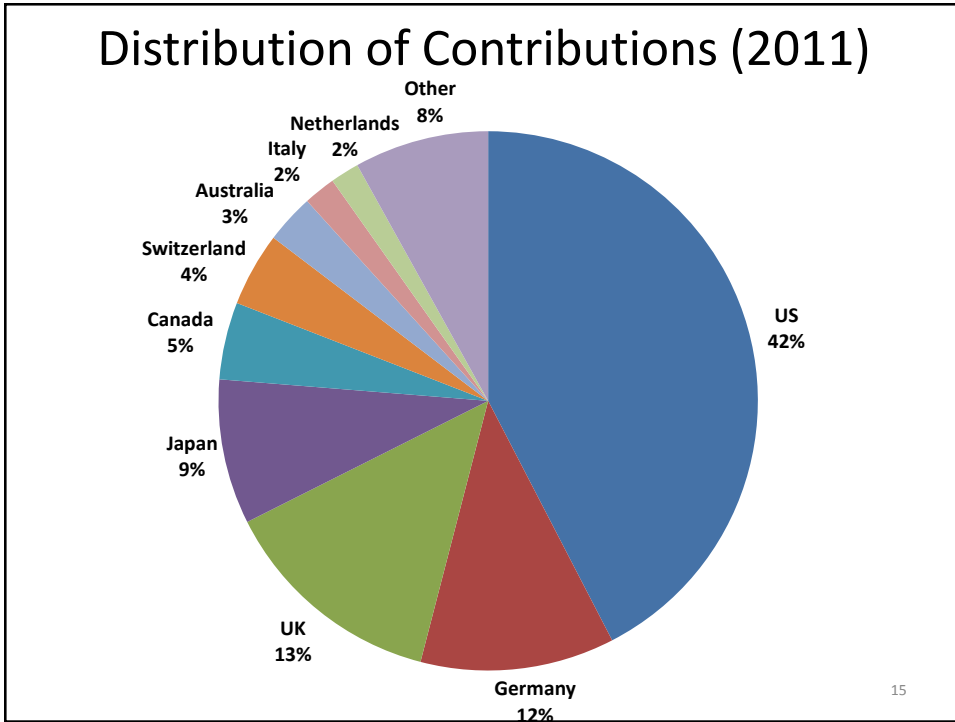

- Target the top 200 based on downloads from institutional domain names
 - Annual contribution tiers per institution:
\$4,000 \$3,200 \$2,300
 - MOUs with key partners including UK/JISC, TIB, Helmholtz, Max Planck, Japan
 - CUL covers 15% of annual expenses plus indirect costs (35% of direct – derived from Cornell’s negotiated rates)

12

	2010	2011	2012 (E)

2010-2011: Sustainability Planning Outcomes

Review and stabilize arXiv staffing and organization:

- Define roles for management, IT development, and user support with clear lines of reporting and responsibility
- Establish a sustainability advisory group
- Start streamlining communication with the scientific advisory board
- Structure the arXiv budget within CUL accounting as an externally funded in support of audits and accountability
- Start transitioning daily moderation role from Paul Ginsparg to CUL

17

2010-2011: Sustainability Planning Outcomes

Evaluate arXiv's IT infrastructure

- Begin migrating the search and display architecture to Invenio (collaboration with CERN)
- Participate in the ORCID initiative
- Assess the preservation status of arXiv and consider CUL's archival repository, Portico, and CLOCKSS

18

2010-2011: Sustainability Planning Outcomes

Assess arXiv's functionality and user support

- Start an initial usability study in support of Invenio-related web interface changes
- Initiate a review of arXiv user guides and help pages
- Participate in NSF-funded Data Conservancy research data pilot
- Analyze arXiv use statistics and usage patterns
 - ✓ Sample submission-based statistics to compare institutional use and submissions (similar pattern)
 - ✓ Based on an analysis of 1,000 arXiv papers, sample representation of NSF-funded research paper in arXiv (~10%)

19

2010-2011: Sustainability Planning Outcomes

Hold discussions with a group of publishers and societies about collaboration opportunities

- Participating: Wiley, Elsevier, American Physical Society, American Mathematical Society, Springer, American Institute of Physics, Institute of Physics, Institute of Mathematical Statistics
- Operational vs. research & innovation budget
- Collaboration areas: Cross linking & versioning; supplementary materials including data; streamlining submission process; author ID and authentication; statistics & business intelligence; content enrichment

20

2010-2011: Sustainability Planning Outcomes

Receive a planning grant from Simons Foundation

Options for arXiv as legal entity:

- arXiv incorporates as a distinct legal entity with no affiliation with Cornell University - 501(C) 3
- ✓ arXiv operation remains wholly owned by Cornell University
