

Nanohybrids for Energy & the Environment Emmanuel P. Giannelis Materials Science and Engineering

KAUST – CU Center for Energy & Sustainability

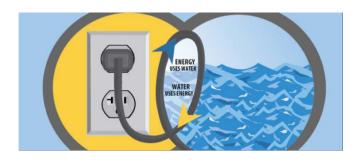

Global Challenges: Technology Driven

- Health
- Energy
- Water
- Environment

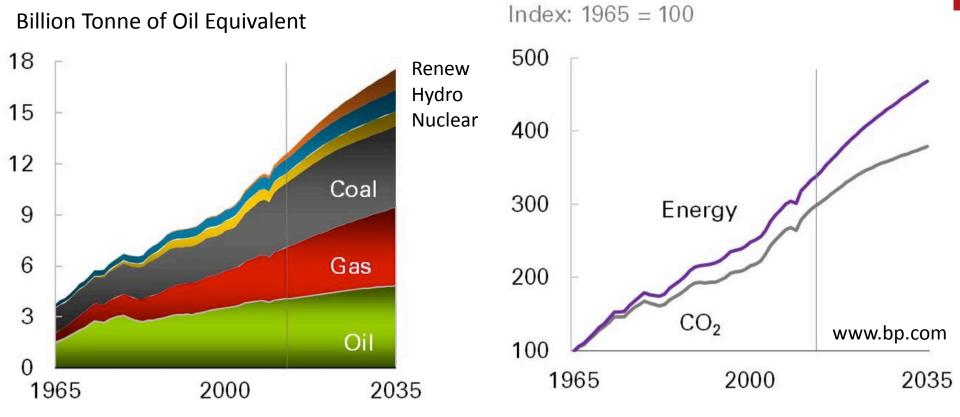

The Energy-Water Nexus

Water purification needs energy

Energy production generates waste water

The Problem: Current & Future Energy Needs

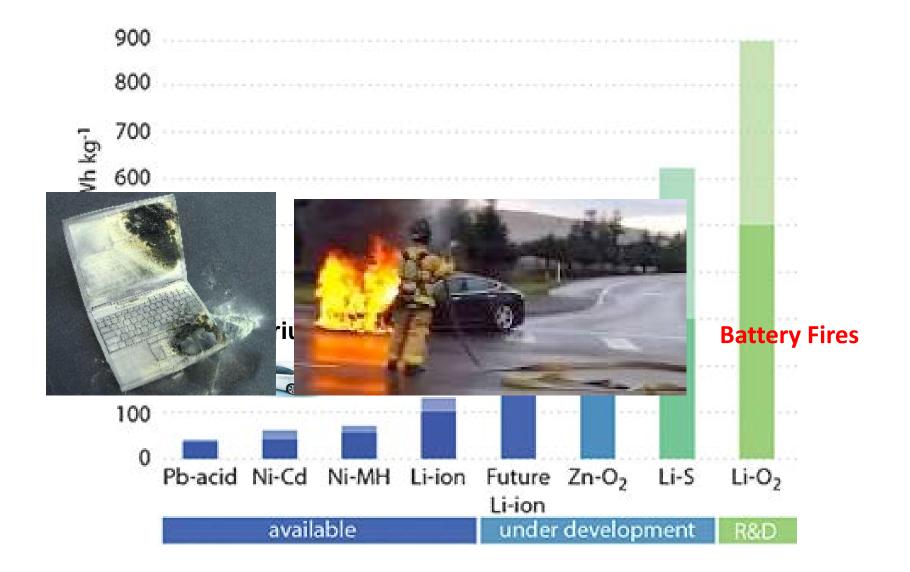

Intensify Development of Renewables Energy Conversion and Storage (Intermittency)

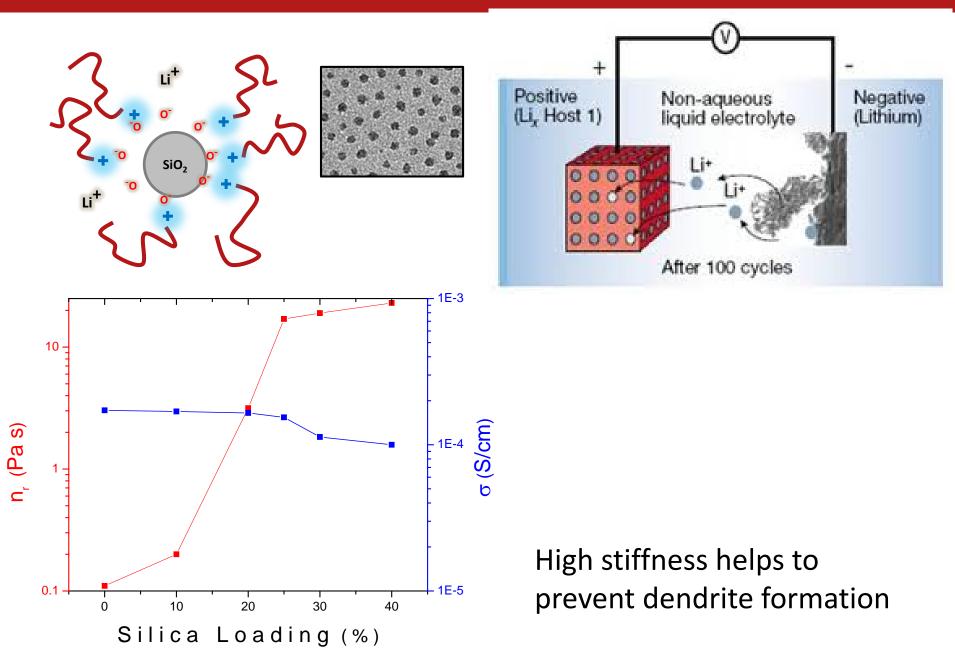

Continue Oil & Gas Exploration and Production

Develop and Implement Carbon Capture and Conversion

Electrical Storage: Batteries

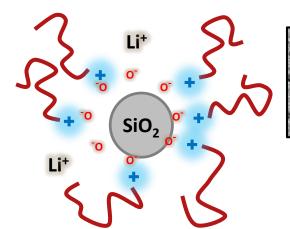

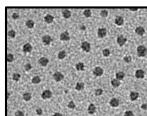

Hybrid Electrolytes: Performance

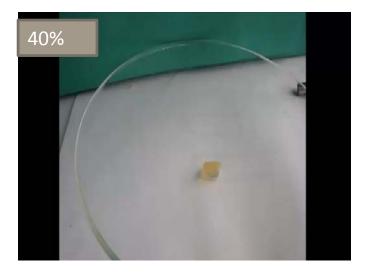

Hybrid Electrolytes: Flammability

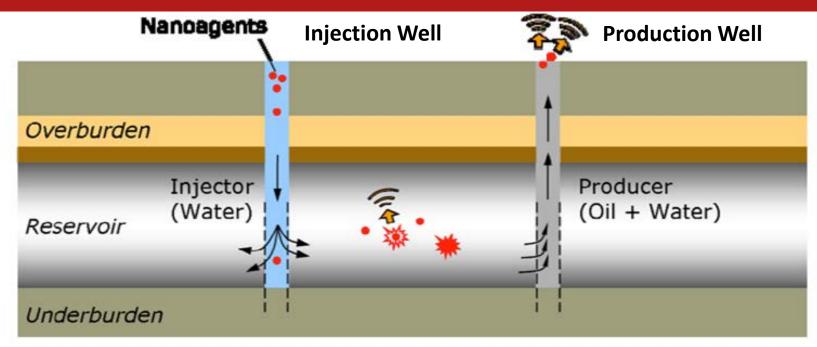

NP Reservoir Monitoring & Remediation

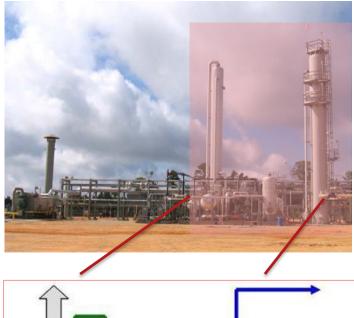

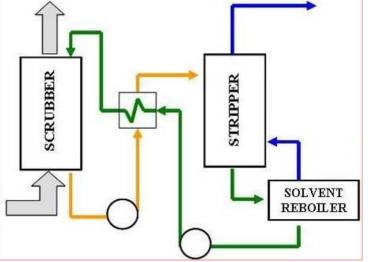

- Map well connectivity (injection wells/production wells) What is the T, P, pH, salinity in the reservoir?
- Estimate oil saturation

is oil present in droplets or big continuous patches?

Deliver surfactants/chemicals into the reservoir in controlled release fashion

Carbon Capture Technologies

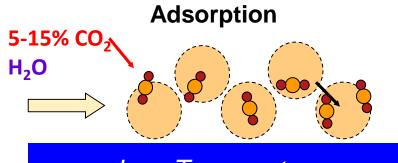

40% of CO₂ emissions from power plants

Post-combustion capture has the greatest near-term potential for reducing CO₂ emissions

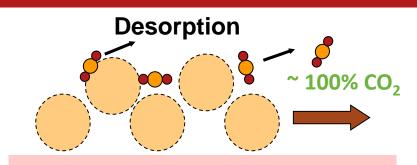

Challenge:

- Low concentration of CO₂ in flue gas
- Often a mixture with other gases including H₂O
- State of the art capture technology
 - Liquid amines scrubbers
 - Problems with evaporation and corrosion
- Potential Solution: Solid Amine Sorbents
 - Issue with capture capacity (<3 mmol/g)

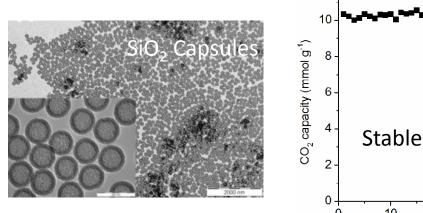

Solution: Solid Amine Sorbents

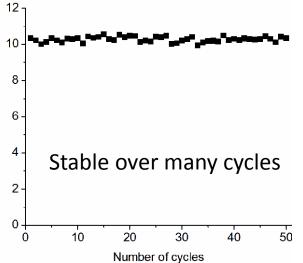

Low Temperature

High Temperature

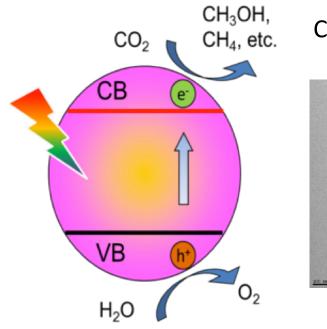

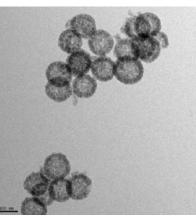

CO₂ Conversion

Corgie

Mtronix

Conversion to Fuels

Carbonic Anhydrase/Magnetic Nanoparticles CO₂ to Carbonate

Conversion to Polyurethanes
