Fall 2008 Contributions

I am a member of the [Design Team](#). For the first part of the semester I worked on some [experimental designs](#) for the Gracias community, since it will be the first plant we build of that large size; it will be about 6 times larger than previous plants. Lots of work was done with trying to design the sedimentation tank slopes, with many versions being created. My part in those versions was limited. I did however play a larger role in designing the new [Sedimentation Tank Slopes program](#). This algorithm will most likely change next semester and so its description will not be uploaded this semester. I have also helped make minor adjustments to the autocad drawings, specifically the baffles and lamina, and those can be found on the [sourceforge](#). Most of my work towards the end of the semester was finalizing the design for [Cuatro Comunidades](#) and documenting [design program algorithms](#) as listed on our [semester goals page](#).
