## Linear Column Buckling

Created using ANSYS 13.0

### Problem Specification

Consider the column in the figure below. It is pinned on both ends and supports an axial load. The column has a circular cross section with a diameter of .5m and is 20m long. It is constructed of structural steel with a Young's modulus of  $2E+11$  Pa and a poisson's ratio of .3. Calculate the critical buckling load of the column.
