Server Change for Nuprl.org - making plans

I spoke with Cornell Computer Science CFS staff about the nuprl site, asking for ideas of how to condense all the material and to include some php programming.

One solution we are following up on is to have our own virtual linux server to run the site off of. I think that will work well for us. Hopefully it will eliminate the file permission problem we've been having on the windows server. We'd also setup a development server where pages could be tested before moving to the live server.

Although the change over process will present some challenges, being able to insert linked files for headers, styles, footers, & dynamic bread crumbs should hopefully save time, and allow global changes to site design in the future.

Work also continues on content updates. Today the System & Lectures pages were updated.

Updated notes on the planned website server change: NuPRL Notes for Server Change.pdf
