Fall 2014 Contributions

This Fall, the Distribution System Contamination Prevention Team focused primarily on completing an in-depth analysis of potential avenues of recontamination to assess how relevant these pathways are to the distribution systems moving water treated by AguaClara. We focused on literature reviews centered on recontamination occurrences in intermittent distribution systems for the first part of the semester. Once we identify potential mechanisms of intrusion, we plan to model them in AutoCAD and provide solutions in how to mitigate these problem.
