

# Goldsen - a special case CUL web site

- It's unusual
  - This is a drupal site in a sub-drectory of a static html site: <http://goldsen.library.cornell.edu/etc/>
  - It also uses Filemaker to supply the contents under <http://goldsen.library.cornell.edu/general/>
    - <http://lib-filemaker.library.cornell.edu/fmi/xml>
- <http://goldsen.library.cornell.edu>
  - this is on victoria01
  - (test site is <http://goldsen.test.library.cornell.edu/> on victoria02)
- The configuration of the site needs to be changed to allow this.
  - /libweb/sites/<domain>/conf/vhost-drupal.conf has a special line in it
    - <Directory "/libweb/sites/[goldsen.test.library.cornell.edu](http://goldsen.test.library.cornell.edu/)/htdocs/etc"> or <Directory "/libweb/sites/[goldsen.library.cornell.edu](http://goldsen.library.cornell.edu/)/htdocs/etc">
- There are special scripts to move the site between victoria01 and victoria02
  - they are in SVN not GitHub
    - <https://svn.library.cornell.edu/cul-drupal/scripts/move-goldsen-to-production.sh>
    - <https://svn.library.cornell.edu/cul-drupal/scripts/move-goldsen-to-test.sh>
  - The drupal-site-moves/set\_permissions.sh script should NOT be used with this site since it is made for normal site configurations
  - move-goldsen-to-test.sh
    - can only be run on victoria02
    - moves the entire site (html static and drupal) from victoria01 to victoria02
  - move-goldsen-to-production.sh
    - can only be run on victoria01
    - moves the entire site (html and drupal) from victoria02 to victoria01
- Pitfalls
  - the Drupal part of the site can come up looking like it's trying to install Drupal if the permissions of settings.php are wrong - they should be:
    - -r--f----- 1 apache lib\_web\_dev\_role 23543 Mar 27 2014 settings.php
