Linping Xu's Individual Contribution Page

Spring 2017

Personal Goals

My goal this semester is to work with one of the wastewater teams, Upflow Anaerobic Sludge Blanket (UASB) team, to develop innovative technologies suitable for small communities such as that in Honduras. In this process, I hope I can get a better understanding on wastewater design especially for UASB using the previous knowledge from former UASB team, enhance team work ability to deal with problems in design, as well as the ability to work on Overleaf.

Contributions

By so far, I've contributed on several things. The first is report writing which everyone has participated in it, the second is helping on the design of test scale experiment, and also contribution to the task managing of our team in order to make us work more efficiently. By the end of semester, we are hoping we can provide quantitative analysis for the innovative designs as an advice for upcoming fabrication team.
