Heat Conduction in a Cylinder

Created using ANSYS AIM 18.1

Problem Specification

Consider the hollow cylinder pictured below with outer radius ($r_o=3.25\text{in}$), inner radius ($r_i=1.75\text{in}$) and length ($l=10\text{ ft}$). The temperature at the inner radius of the cylinder is 400 degrees Fahrenheit while the outside radius of the cylinder is 80 degrees Fahrenheit with a coefficient of heat transfer of $0.04\text{ Btu}\cdot\text{h}^{-1}\cdot\text{ft}^{-2}\cdot\text{F}^{-1}$.

In this tutorial, we will utilize ANSYS AIM to find the temperature throughout the pipe, total heat flux and directional heat flux.
