

Using the CUL FOLIO Analytics Report Repository

The CUL (Cornell University Library) FOLIO Analytics Report Repository is an archive of SQL scripts developed for and used by Cornell Library staff for reporting. Reports are written to support the need for operational data and data analytics from the Cornell Library's central ILS (Integrated Library System), the FOLIO system (Future of Libraries is Open). Reports are available for all functional areas of the library, such as circulation, acquisitions, collection development, accounting, collection management, cataloging, and annual statistics. The goal of the repository is to store master copies of each of the queries. The query repository will grow as library staff identify additional reporting needs. As new versions of reporting database software are released, the queries will be updated and optimized.
