Subjects and Series changes for Orchid

For the Orchid release of FOLIO, there will be changes to updates to instance records (subjects and series) to capture changes associated with authority control.

To accommodate these changes, the FOLIO Analytics derived tables release for Orchid 1.6 will include these changes in the following derived tables:

- instance_subjects
- instance_series

Subjects:

```
json_extract_path_text(subjects.data, 'value') AS subject,

subjects.ordinality AS subject_ordinality

FROM    inventory_instances AS instances

CROSS JOIN json_array_elements(json_extract_path(instances.data, 'subjects'))

WITH ORDINALITY AS subjects (data);
```

Series:

```
SELECT
    instances.id AS instance_id,
    instances.hrid AS instance_hrid,
    json_extract_path_text(series.data, 'value') AS series,
    series.ordinality AS series_ordinality
FROM
    inventory_instances AS instances
    CROSS JOIN json_array_elements(json_extract_path(instances.data, 'series'))
    WITH ORDINALITY AS series (data);
```
