

Miscellaneous Notes on Metadb

-Nassib says that for metadb, the tables are only streamed if and when they have data

When there is a new tag for folio-analytics (such as <https://github.com/folio-org/folio-analytics/tree/v1.7.6> or <https://github.com/folio-org/folio-analytics/tree/v1.7.7>)

will a new tag for metadb be created that includes the updated analytics version?

Hi @nassib - Per the question @Carole Godfrey poses above, we are trying to develop best practices for staying up-to-date on the metadb software releases and the folio-analytics software releases. If new versions of the metadb software are bundled and released with the latest versions of the folio analytics software, we just need to stay up-to-date on the metadb software releases. It's not clear if that is what is happening, however. Would you please advise us on best practices for keeping both metadb and folio-analytics up-to-date?

At the moment the versions are tied together. The intention is to make the folio-analytics version configurable. For now the only option is to run a recent stable release of Metadb, and that will determine the version of folio-analytics.

When a new tag is created for folio-analytics, it will typically be used in the next Metadb release.

Okay, @nassib. Thank you. That's helpful to know. When you say "recent stable release of Metadb," does that mean the most recent tagged version listed here? <https://github.com/metadb-project/metadb/tags> (YES)

Not including beta releases.
