

ANSYS - Truss Step 5

Problem Specification
1. Start-up and preliminary set-up
2. Specify element type and constants
3. Specify material properties
4. Specify geometry
5. Mesh geometry
6. Specify boundary conditions
7. Solve!
8. Postprocess the results
9. Validate the results
Problem Set 1
Problem Set 2

Step 5: Mesh geometry

Each truss member can be represented as a 2D Spar element. We'll use the *MeshTool* to mesh the geometry with this element.

To bring up the *MeshTool*, select

Main Menu > Preprocessor > Meshing > MeshTool

The *MeshTool* is used to control and generate the mesh.

Set Meshing Parameters

We'll now specify the element type, real constant set and material property set to be used in the meshing. Since we have only one of each, we can assign them to the entire geometry using the *Global* option under *Element Attributes*.

Make sure *Global* is selected under *Element Attributes* and click on *Set*.

MeshTool

Element Attributes:

☐ Smart Size

Size Controls:

Global

Areas

Lines

Layer

Keypts

Mesh:

Shape: ☒ Radio1 ☐ Hex/wedge

☒ Free ☐ Mapped ☐ Sweep

Refine at:

This brings up the *Meshing Attributes* menu. You will see that the correct element type, material number and real constant set are already selected since we have only one of each.

Click **OK**. ANSYS now knows what element type (and associated constants) and material type to use for the mesh.

Set Mesh Size

Since a *LINK1* element is equivalent to a truss member, we will specify that we want only one element per line. This is a subtle point and also very unusual; in most problems, you want to subdivide your part into many elements.

In the *MeshTool*, under **Size Controls** and **Lines**, click **Set**.

In the pick menu that comes up, click **Pick All** (since we want the specification of mesh size to apply to all lines in the geometry). This brings up the *Element Sizes on Picked Lines* menu. Specify **No. of element divisions** to be 1. Click **OK**. ANSYS will now use 1 element to mesh each line.

Mesh Lines

In the *MeshTool*, make sure **Lines** is selected in the drop-down list next to **Mesh**. This means the geometry components to be meshed are lines (as opposed to areas or volumes, as we'll see later). Click on the **Mesh** button.

This brings up the pick menu. Since we want to mesh all lines, click on **Pick All**. The lines have been meshed. This is reported in the *Output Window* (usually hiding behind the *Graphics Window*):

```
NUMBER OF LINES MESHED = 3
MAXIMUM NODE NUMBER = 3
MAXIMUM ELEMENT NUMBER = 3
```

Close the *MeshTool*.

View Element List

Utility Menu > List > Elements > Nodes + Attributes

ALIST Command

File

LIST ALL SELECTED ELEMENTS. <LIST NODES>

ELEM	MAT	TYP	REL	ESY	SEC	NODES	
1	1	1	1	0	1	1	2
2	1	1	1	0	1	3	2
3	1	1	1	0	1	1	3

This table says that *Element 1* is of *material type 1* and *element type 1* and is attached to nodes 1 and 2 and so on. In this element list, the order of the two nodes for each element doesn't matter. For example, element 3 can be attached to nodes 2 and 3 or equivalently, nodes 3 and 2. Also, the order of element numbering is not important since it is for internal bookkeeping.

Close the window listing the elements.

View Node Location

In order to see where the nodes are located, you can look at the list of nodes.

Utility Menu > List > Nodes

In *Sort NODE Listing* menu, click **OK** to accept defaults.

Sort NODE Listing

[NLIST] Select node-list format and sorting criteria

Output listing will contain

☒ Coord, w/ Angles
☐ Coordinates only

Sort first by: NODE Number

Sort second by: NODE Number

Sort third by: NODE Number

OK Apply Cancel Help

My list of nodes looks like this:

ALIST Command

File

LIST ALL SELECTED NODES. DSYS = 0

Sort TABLE ON NODE NODE NODE

NODE	X	Y	Z	THX	THY	THZ
1	0.0000	2.0000	0.0000	0.00	0.00	0.00
2	0.0000	0.0000	0.0000	0.00	0.00	0.00
3	1.5000	2.0000	0.0000	0.00	0.00	0.00

From the node and element lists, one can conclude that in this case:

Node 1 is pin A

Node 2 is pin C

Node 3 is pin B

Element 1 is member AC

Element 2 is member AB

Element 3 is member BC

Your own node and element numbering might be different from this and you would have to account for this while interpreting results in the postprocessing step.

Close the window listing the nodes.
